

HL7 Version 3 Detailed Clinical Models, Release 1

DCM example Body Weight v 1.08

January 2013

HL7 Informative Document

**Sponsored by:
Patient Care Work Group**

IMPORTANT NOTES:

HL7 licenses its standards and select IP free of charge. **If you did not acquire a free license from HL7 for this document**, you are not authorized to access or make any use of it. To obtain a free license, please visit <http://www.HL7.org/implement/standards/index.cfm>.

If you are the individual that obtained the license for this HL7 Standard, specification or other freely licensed work (in each and every instance "Specified Material"), the following describes the permitted uses of the Material.

A. HL7 INDIVIDUAL, STUDENT AND HEALTH PROFESSIONAL MEMBERS, who register and agree to the terms of HL7's license, are authorized, without additional charge, to read, and to use Specified Material to develop and sell products and services that implement, but do not directly incorporate, the Specified Material in whole or in part without paying license fees to HL7.

INDIVIDUAL, STUDENT AND HEALTH PROFESSIONAL MEMBERS wishing to incorporate additional items of Special Material in whole or part, into products and services, or to enjoy additional authorizations granted to HL7 ORGANIZATIONAL MEMBERS as noted below, must become ORGANIZATIONAL MEMBERS of HL7.

B. HL7 ORGANIZATION MEMBERS, who register and agree to the terms of HL7's License, are authorized, without additional charge, on a perpetual (except as provided for in the full license terms governing the Material), non-exclusive and worldwide basis, the right to (a) download, copy (for internal purposes only) and share this Material with your employees and consultants for study purposes, and (b) utilize the Material for the purpose of developing, making, having made, using, marketing, importing, offering to sell or license, and selling or licensing, and to otherwise distribute, Compliant Products, in all cases subject to the conditions set forth in this Agreement and any relevant patent and other intellectual property rights of third parties (which may include members of HL7). No other license, sublicense, or other rights of any kind are granted under this Agreement.

C. NON-MEMBERS, who register and agree to the terms of HL7's IP policy for Specified Material, are authorized, without additional charge, to read and use the Specified Material for evaluating whether to implement, or in implementing, the Specified Material, and to use Specified Material to develop and sell products and services that implement, but do not directly incorporate, the Specified Material in whole or in part.

NON-MEMBERS wishing to incorporate additional items of Specified Material in whole or part, into products and services, or to enjoy the additional authorizations granted to HL7 ORGANIZATIONAL MEMBERS, as noted above, must become ORGANIZATIONAL MEMBERS of HL7.

Please see <http://www.HL7.org/legal/ippolicy.cfm> for the full license terms governing the Material.

Revision History

Version 0.1 till version 0.91 is development, review and adjustments of the DCM. Version 0.91 is developed in Enterprise Architect.

Version 0.92 till version 0.97 is adjusted in cooperation with the project Parelsnoer Initiative. The scope was the development of the information model.

Version 0.98 is the English translation of version 0.97.

Version 0.99 is the adjustment to the new template for a DCM and the preparation for the HL7 ballot. Versions 1.00 - 1.02 are in between after the HL7 ballot where only some changes were applied. Version 1.03 is the full changes carried out according to the Sept 2010 HL7 ballot reconciliation of August 2011.

Subsequent versions have been created to satisfy the needs of the Onze Lieve Vrouwe Gasthuis (OLVG), additional HL7 ballot comments, and Stichting Health Base.

Version 1.08 is the one implemented in OLVG nursing care record and Stichting Health Base Pharmabase.

Concept

This DCM Body weight concerns the observation of the weight of a persons' body.

Mindmap

None available

Purpose

The purpose is to determine the total body weight of a person. Measuring body weight is important to calculate correctly the appropriate dose of some medicines, for example anesthesia. Also the weight can be an indication of one's health. Measuring weight over time can also be useful to assess or prevent malnutrition.

Patient population

Every person can have their body weight measured. The measuring devices that are used to determine the body weight can be different for the different target groups.

This DCM is not intended for the different variants of fetal weight.

Evidence Base

The relation between the amount of energy that the body consumes and the amount the body needs is reflected in the body weight. A healthy body weight will not increase the risk of diseases like cardiovascular diseases, certain types of cancer and diabetes (www.voedingscentrum.nl, 2008). Body Weight measurement is an important factor to determine the quality of the state of nutrition of a person. (Transferpunt VaardigheidsOnderwijs, 2004). Body weight is also a part of the physical examination of a physician. (NHG standaarden, 2008). In that case the body weight could be, for example, a starting value for the effect of a treatment. (NHG standaard Hartfalen, 2008).

The body weight is important in (Transferpunt VaardigheidsOnderwijs, 2004):

Nutrition: the relation between the amount of consumed nutrition value and the needs of the patient;

The calculation of the amount of anesthetic, pain medication or other medication;

The effect of the disease;

- Normal or abnormal increase or decrease of body weight;
- Problems in maintaining a healthy body weight;
- Eating disorders.

Body weight measurement can take place in any healthcare setting and is carried out by, among others, physicians, nurses, physicians assistant, dietician etc. The frequency of the measuring of body weight depends on the importance for the health and treatment of the patient. Patients who need to be regularly measured are, for instance patients that:

Are severely weakened or emaciated as a result of their illness or have a fortifying diet;

Have a health risk caused by their high body weight or have a slimming diet;

Have undergone or will undergo major surgery;

Have fluid accumulation or are at risk for fluid accumulation (Arets, Vaessen & Gijsselaers, 1988).

In measuring body weight, the following items are of importance:

- The scale that is used to measure body weight;
- The clothes worn by the patient;
- Whether someone wears shoes or not;
- Whether someone did or did not go to the bathroom;
- The time of day the weighing is done;
- The unit in which the weight is expressed;
- Whether someone has gained weight or lost weight.

All these variables are further specified.

When interested in the effect of an intervention, multiple measurements must take place over time.

These measurements can be placed into a curve, so changes in body weight will become visible. Of interest is determining whether the patient has a healthy body weight or an unhealthy body weight. In that case, the height also has to be measured.

Body weight percentile is a very common associated observation (esp for young children).

BodyWeight **is a** *physical quantity*

BodyWeight **has** BodyWeight

—

Concept	Definitie
BodyWeight <i>SCT: 363808001 body weight measure</i>	The outcome of the measurement of the body weight of an individual by means of a patient scale.

Concept	Definitie
BodyWeight <i>SCT: 27113001 body weight, SHB: GEWICHT</i>	The body weight of the patient.
Constraint	Unit kilogram inv:unit='kg'
Constraint	Between 0 and 1000 kilogram inv:value>=0 and value<1000

Concept	Definitie
BodyWeightValueOrigin <i>SCT:255395001 origins</i>	Description for recording whether the weight value is measured, stated, or estimated. Estimated <i>SnomedCT: 414135002 Estimated</i> Measured <i>SnomedCT: 258104002 Measured</i> Stated <i>SCT:278412004 human-origin</i>

Concept	Definitie
Clothing <i>SCT: 248159006 state of clothing</i>	Description of the amount of clothing worn at the time of the observation of the weight. Diaper <i>R4C: R4CDCM1-5</i> Person only wears a diaper during the weighing. LightlyDressedOrUnderwear Person has taken of the upper layer of clothing on behalf of the weighing. <i>R4C: R4CDCM1-4</i> Naked Person wears no clothing during the weighing. <i>SNOMED-CT: 248160001 undressed</i> FullyDressed Person has not taken of his clothing on behalf of the weighing. <i>Snomed CT: 301306007 Dressed - appearance</i>

Concept	Definitie
Device <i>SCT: 5042005 patient scale</i>	Description of scale type. Especially in repeated measuring of the body weight it is of importance to use the same scale.

	BedScale <i>R4C: R4CDCM1-3</i>	The person is immobile and is measured with his bed.
	ChairScale <i>R4C: R4CDCM1-2</i>	A person is limmited in his mobility and can only sit on a scale with an integrated scale.
	FloorScale <i>R4C: R4CDCM1-1</i>	A person is mobile and can stand on a scale himself. The scale can be analogue or digital.
	Other <i>NullFlavor: OTH different form the other options</i>	An other type of scale than the types already metioned has been used.

Example Instances

None Available.

Instructions

The body weight is determined with a scale; either digital or analogue. In weighing several points of interest are to be accounted for (Transferpunt VaardigheidsOnderwijs, 2008):

- The rate of mobility of a person. The choice of scale depends on the mobility of a person.
- Whether someone has used the bathroom. Otherwise make sure they do use the bathroom.
- Use the same scale for every measurement and make sure it is adjusted correctly;
- Every time you weigh a person make sure he wears the same, light, clothes. When weight is a critical factor, weigh only wearing underwear;
- Weigh a person on approximately the same time every day.

The weight is noted in the health record as observation.

Interpretation

A first interpretation of body weight is done after notation in the health record. This interpretation is based upon the weight curve related to the aim of the treatment. (Transferpunt VaardigheidsOnderwijs, 2008).

Beside that, a judgement on the quality of the state of nutrition of a person does not only depend on body weight but also on height (Transferpunt VaardigheidsOnderwijs, 2008, www.voedingscentrum.nl, 2008).

Care Process

The determination of body weight of a person is part of the physical examination and can be done once or repeatedly depending on the heath condition of a person. Also body weight is a part of the medical history. Based on body weight, as well as on other observations, a physician can make a decision on treatment.

Example of the Instrument

None Available.

Constraints

None Available.

Issues

General issue in the information model:

There are concepts with a BL datatype. Depending on the answer the code for <data> concept shall be changed.

E.g. SNOMED-CT: 424927000 body weight with shoes (observable entity). If the <state> Wears shoes (BL) is true the code of <data> Body weight<PQ> shall be changed.

It is desirable that there is a Snomed CT code for "Wears Shoes".

Missing code for stated in the class TypeValue.

Copyrights

There are no copyrights involved in the measure of bodyweight.

Terms of Use

The DCM is open source, so free to use, not to be changed.

Changes in the content and codes are seen upon as a infringement of copyright for the DCM and is damaging for the goal of use: realization of semantic interoperability.

You can suggest additions and changes at: DCMHelpdesk@results4care.nl

Revision suggestions will be looked at and may lead to:

- revised DCM and results if accepted
- variations of the DCM adapted on a local situation.

This is all based upon : a “common ownership” but not a “special stewardship”.
